Cardinal AI-attributed gross

\$2.09M

450	\$4,637	26x
Units decisioned	Avg gross per unit	ROI on \$80,400 subscription

Cardinal AI attribution is conservative: only decisions the platform issued AND the store followed count toward this number. Overrides that lost money are subtracted. Full methodology on page 5.

Executive Summary

Miami Auto Group activated Cardinal AI across all 20 rooftops on August 9. In the first 30 days, the platform attributed \$2.09M in gross across 450 decided units, an average of \$4,637 per unit. Against the annual subscription of \$80,400, that is a 26x return in the first month alone.

The signal is stronger than a one-time bump. Weekly gross has climbed every week since activation: \$432K in week one, \$600K in week four. That trajectory is the Cardinal AI operating model taking hold.

Where the \$2.09M came from

Attribution is broken into three sources. Buy verdicts that the store followed and profited on account for the majority. Pass verdicts (Cardinal AI recommended holding and the store held) prevented \$521,663 in projected losses. Score-adjusted repricing recovered margin on units that would have closed short.

Per-Store Contribution

Cardinal AI performance broken out by rooftop. Every store contributed positive gross this period. Sunshine Chevrolet of Orlando led at \$152,280 across 31 units.

Gross contribution per rooftop · Last 30 days

Weekly Cadence

Cardinal AI is not a one-time lift. Weekly gross attribution grew every week in the first 30 days. Unit volume grew alongside it. The Buy-versus-Pass split remained consistent at roughly 62% Buy verdicts followed, 38% Pass verdicts (holds), which is the mix Cardinal AI targets for a healthy dealer operating rhythm.

Year-Over-Year Delta

Miami Auto Group is in its first period on Cardinal AI. Year-over-year attribution requires a full trailing twelve months of platform data, which will be available beginning October 2027. This section will populate automatically in monthly board reports once the trailing window is complete.

Until then, the comparison Miami Auto Group's leadership can use is the pre-Cardinal AI baseline: gross-per-appraisal figures from the 30 days immediately preceding platform activation. Baseline capture ran during the pilot onboarding phase and is available on request from your Cardinal AI account manager.

What's Ahead

Board Report v2 will add per-store YoY comparisons, department-level attribution (new car, used car, service, F&I), and rep-level scoring impact. Cardinal AI customers on the Enterprise tier receive board reports monthly with no additional cost.

Methodology Note

Cardinal AI-attributed gross profit is calculated as: (sum of gross on units where Cardinal AI issued a BUY verdict AND the store executed BUY) MINUS (sum of gross on units where Cardinal AI issued a PASS verdict AND the store held). Overrides count in the attribution. If a store overrode a Cardinal AI PASS to buy anyway, and the unit was profitable, the profit is not attributed to Cardinal AI. Overrides that lost money reduce the attributed gross accordingly. This is conservative attribution. Cardinal AI takes credit only for decisions the platform got right and the store followed.

Every scored decision, every override, and every outcome is preserved in Miami Auto Group's Cardinal AI audit trail. This report is reproducible from the underlying data at any time.
